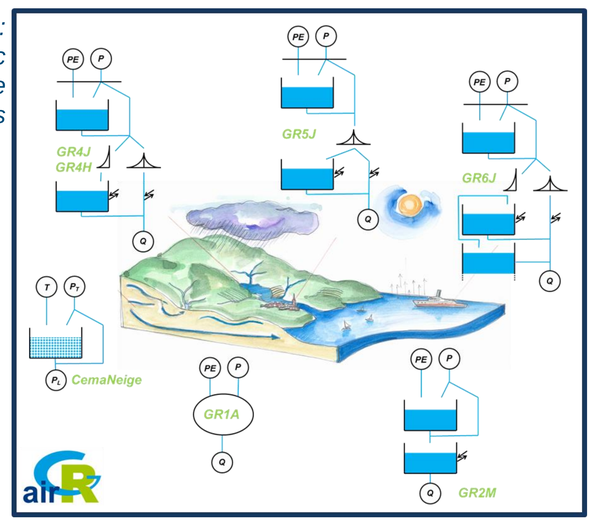
airGR: an R-package suitable for large sample hydrology presenting a suite of lumped hydrological models

GR is a family of lumped hydrological models designed for flow simulation at various time steps. The models are now available in a flexible R-package called airGR (Coron et al., 2017, submitted). The models can easily be implemented on a set of catchments with limited data requirements.

The GR hydrological models

The GR models were designed with the objective to be as efficient as possible for **flow simulation at various time steps**, ranging from hourly to interannual (Perrin et al., 2009).
The model structures were developed to have warranted complexity and **limited data requirements**.
The models can be applied on a wide range of conditions, including snowy catchments thanks to the CemaNeige **snow routine**.

Fig. 1: Schematic diagram of the GR models



The airGR functionalities

- Easy implementation on numerous catchments
- Data requirements limited to precipitation, temperature and streamflow time series
- One **automatic calibration procedure**
- A set of **efficiency criteria**
- Limited computation times (use of Fortran routines to run the models)
- Pre-defined **graphical plots**
- Outputs include simulated flow time series and internal variables
- Easy implementation of external user-defined models, efficiency criteria or optimization algorithms
- **Online Tutorial**: https://webgr.irstea.fr/airGR-website
- R-embedded help following the R standards

Future developments

Shiny interface and teaching-friendly functions.

Download the airGR package

The airGR package is available after email registration on the following website:
http://webgr.irstea.fr/airgr/?lang=en

G. Thirel[1], O. Delaigue[1], L. Coron[1,2], C. Perrin[1] and V. Andréassian[1]
